(54) METAL ANCHOR HARDWARE

(57) [Abstract]

[Object] Providing a metal anchor hardware capable of fixing a structure member to a concrete structure efficiently, without numerous labor and operations which are strict and precise, said metal anchor hardware utilized in order to attach and fix the structure member to the concrete structure with a space in between.

[Configuration] A metal anchor hardware including an anchor bolt 2 to be buried one end thereof into a concrete structure 6 and a bolt 4 to be engaged one end thereof to a structure member, other ends of the anchor bolt and the bolt are connected to each other with a connecting metal fitting 1. Said connecting metal fitting 1 is connected to both of the anchor bolt and the bolt so as to rotate freely around an axis and swing in any direction. Therefore, though the anchor bolt and the bolt do not have precisely correct positions, it is possible to fix the structure member to the concrete structure by connecting the anchor bolt and the bolt.
